EXAM: CT OF THE SINUSES - STEALTH PROTOCOL

INDICATIONS: Chronic migraines, headaches.

TECHNIQUE: CT of the sinuses, head, and skull base, STEALTH protocol, with direct coronal imaging.

FINDINGS: The cerebral cortex and white matter of the cervical hemispheres are normal. The ventricles are normal. The midbrain, pons, and medulla are normal. The posterior fossa structures and cisterns are normal.

The frontal, ethmoid, sphenoid, and maxillary sinuses are well aerated. There is a type I olfactory fossa. The bone of the fovea ethmoidalis is thinned bilaterally. There is no meningocele. The bone of the roof of the sphenoid sinus is intact. There is minimal focal mucosal thickening in the left inferior maxillary sinus consistent with a mucous retention cyst measuring 4 mm. The nasal septum is deviated to the left. There is a bony osteophyte along the left side of the septum. There is mild right more pronounced than left middle and inferior turbinate enlargement. The cartilaginous septum is deviated to the right. The orbits are normal. The mastoid air cells and skull base are normal. There are left pharyngeal tonsilar calcifications.

IMPRESSION:

1. There is no sinusitis.

2. There is a deviated septum. There is a bulge along left side of the septum.

3. There is rhinitis.

4. There are left pharyngeal tonsilar calcifications. This may be associated chronic mouth breathing.

5. The bone of fovea ethmoidalis is thin bilaterally and could be dehiscent. There is no meningocele.
