RADIOLOGY REPORT

Ashburn, Trenton

MRN 5877870

Visit # 240843477

HAR 2064019960

Patient Information

Age/Sex 43 year old/Male

Birth Date 4/29/1978

Signs & Symptoms

History Positional headache

Order Information

Exam(s) **MR TOTAL SPINE WITHOUT CONTRAST**
[IMG5195]

Accession # 20345987

Exam Date 12/22/2021 1258

Ord Provider Wilhour, Danielle Alyse, MD

Final

MR TOTAL SPINE WITHOUT CONTRAST - 12/22/2021, 1258.

HISTORY: "rule out CSF leak"

TECHNIQUE: Multisequence and multiplanar noncontrast MRI of the entire spine with heavily T2 weighted, 3D sequences targeted for the evaluation of CSF leak. Imaging performed at 1.5 Tesla.

COMPARISON: Outside MRI brain 7/16/2021, outside MRI cervical spine 4/28/2020.

FINDINGS:

General findings: Normal vertebral body heights and alignment. No suspicious marrow signal abnormality.

Degenerative findings: Minimal lower lumbar degenerative disc disease. No significant spinal canal or neural foraminal narrowing at any level.

Perineural cysts/meningeal diverticula:

Cervical: Normal nerve root sleeves without meningeal diverticula.

Thoracic: Minimally prominent meningeal diverticulum at right T6-7.

Lumbar: Normal nerve root sleeves without meningeal diverticula.

Extradural collections: None.

Paraspinal musculature/soft tissues: No discrete mass.

IMPRESSION:

1. No extradural collection suggestive of spinal CSF leak.
2. Single minimally prominent meningeal diverticulum at right T6-7. Though CT dynamic myelography may be considered, the likelihood of CSF venous fistula is exceedingly low given relative paucity of meningeal diverticula.

This exam was interpreted by a University of Colorado School of Medicine board certified radiology physician with subspecialty certification in neuroradiology. To speak with a radiologist regarding this report or other radiology questions, call 720-848-RADS (7237).
